

Master Page

To start - open your Visual Studio 2010, File and choose New Web Site, choose C#.

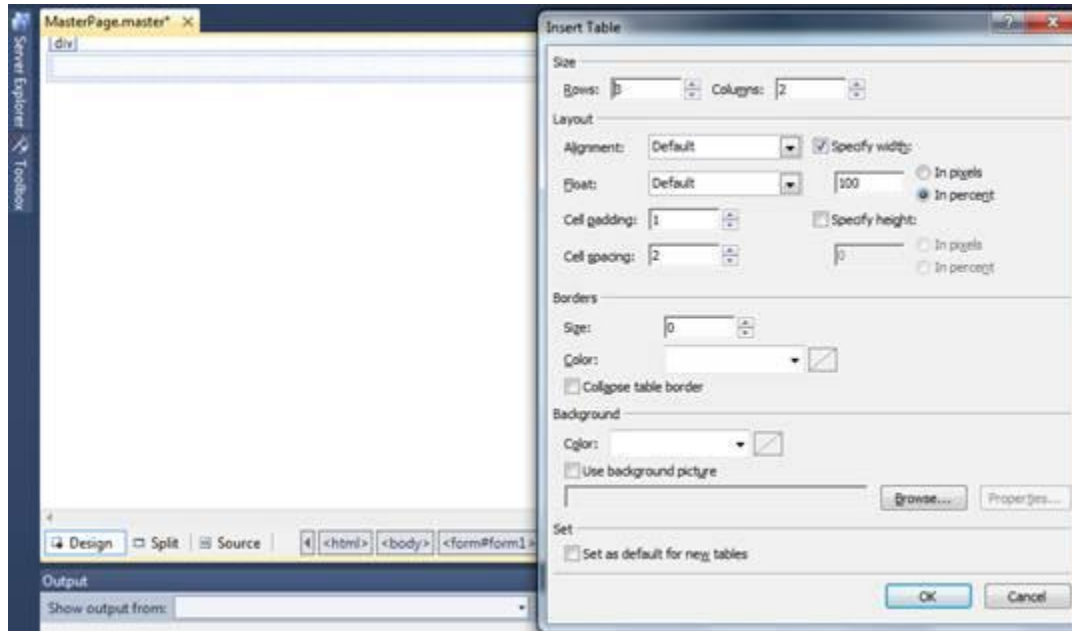

Choose ASP.NET Empty Web Site. Make the default File System; you can change the file directory of your file. Just simply browse and name your folder where your file is being saved and click Ok.

Add a Master Page. To do that, in your solution explorer, right click the name of your website and choose Add new item. Choose **MasterPage.master**

```
<%@ Master Language="C#" AutoEventWireup="true"
    CodeFile="MasterPage.master.cs" Inherits="MasterPage" %>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
    "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head runat="server">
    <title></title>
    <asp:ContentPlaceholder id="head" runat="server">
    </asp:ContentPlaceholder>
</head>
<body>
    <form id="form1" runat="server">
    <div>
        <asp:ContentPlaceholder id="ContentPlaceholder1" runat="server">
        </asp:ContentPlaceholder>
    </div>
    </form>
</body>
</html>
```

In the above menu, click table and insert table:

In toolbox, choose Hyperlink and drag in your Page. Make 3 copies and name them Home, About, and Settings.

In your Solution Explorer, click your web site name, right click and Add new item. Choose C# and click Web Form. The default name is default, change it to Home to make it more meaningful. Remember; make sure to check the select master page and Add.

When you notice another dialog box appears, it does mean that you are in the Master Page control. Click **MasterPage.master**, then Ok.

```
<%@ Page Title="" Language="C#" MasterPageFile="~/MasterPage.master"
    AutoEventWireup="true" CodeFile="Home.aspx.cs" Inherits="Home" %>
<asp:Content ID="Content1" ContentPlaceHolderID="head" Runat="Server">
</asp:Content>
```

Do the same procedure like what you created in the Home web form and name it About and Setting. Now you've already created 3 Web Forms.

Back to the Master Page, drag Content Placeholder from your toolbox in your Master Page.

Gdf

Click Home menu hyperlinks, in your properties setting, locate Navigate URL, click ... and choose Home Web Form that corresponds to your menu. Do the same procedure when you link About and Settings Menu.

Now, click debug to start debugging or press F5 to run you program. The first time you run your program, it shows dialog box, click ok to continue. Then the output of your program looks like:
